

Android Programming Lab (UIANP308P)

Practical Questions - Set 3 (Qs 11 to 15)

Q 11

Design a Temperature Converter using LinearLayout.

- a) The screen contains an EditText, a RadioGroup with two options (Celsius to Fahrenheit, Fahrenheit to Celsius), a Convert button and a result TextView. Labels, hints and colors must come from string and color resources; sizes from dimension resources.
- b) On clicking Convert, perform the selected conversion and display the result with two decimal places.
- c) If the input is empty or no option is selected, show an AlertDialog; the result TextView must be shown in a different color for each conversion type.

Q 12

Using AbsoluteLayout, design a Feedback screen.

- a) Place a TextView (heading), an EditText (name), an EditText (comments) and a Submit button at fixed x and y positions; the position values and sizes must be defined as dimension resources, and text/colors as string and color resources.
- b) On clicking Submit, display the name and comments in a TextView at the bottom of the screen.
- c) If the name is empty, show an AlertDialog; otherwise also show a Toast "Thank you".

Q 13

Using RelativeLayout, design a Rating screen.

- a) Place a TextView, a RatingBar, an EditText for comments and a Submit button so that every view is positioned relative to another view. Use string, color and dimension resources.
- b) On clicking Submit, display the rating and comments in a TextView.
- c) If the rating is below 3, show the message in red (from color resources) and an AlertDialog asking "Would you like to add more details?"; otherwise show it in green with a Toast.

Q 14

Create a Profile Card application with a custom theme.

- a) Using LinearLayout, show an image from the drawable folder, a name, a course and a short description in TextViews. Image size and margins must be dimension resources, all text must be string resources, and a custom theme with its own colors must be applied.
- b) Add a "Switch Mode" button that toggles the card between a light color set and a dark color set (both defined as color resources).
- c) Add a "Contact" button that shows an AlertDialog with the email and phone number.

Q 15

Using TableLayout, create a Multiplication Table application.

- a) The screen contains an EditText for a number, a Generate button and a TableLayout below it. Labels and colors must be string and color resources.
- b) On clicking Generate, populate the table with rows for the multiplication table of the number from 1 to 10 (each row showing the expression and the result), with alternate rows in different colors.
- c) If the input is empty or zero, show an AlertDialog; add a Clear button that removes all the rows.
